

2.2 Correlation analysis

Interpret the **DIRECTION** of the relationship

- The direction is positive. When it get warmer outside, traffic increase bur when it is freezing cold, the traffic drops a little bit.

Interpret the **STRENGTH** of the relationship

- The strength is weak because the number close to 0. This mean that the temperature not really control the traffic.

Explain why correlation does not necessarily imply causation.

- Because 2 things happen at the same time do not mean one caused the other. Example, Heavy traffic during peak hours is because people are going back home, It happen regardless of the weather.
